Introduction: Many studies show that the prevalence of overweight and obesity among children is rapidly increasing and developing into a major public health problem worldwide.

Objectives: To assess the Body Mass Index (BMI) in school children from 2nd and 3rd cycles in Viseu schools and identify the sociodemographic, behavioural and educational factors that are related to the BMI.

Methods: This is a quantitative descriptive and explanatory study with a convenience sample of 742 students attending schools of the 2nd and 3rd cycles in Viseu schools and identify the sociodemographic, behavioural and educational factors that are related to the BMI.

Results: It was found that some sociodemographic factors were associated with BMI, namely age, school year, practicing high competition sport, being federate in a sport or vegetarian diet. Regarding the educational factors associated with BMI these included only the seminars given at school by specialist in nutrition. Furthermore, a significant relation between BMI and SF was found, where SF represents the school sources of knowledge. Finally among the behavioural factors associated to BMI stood: learning in classes, playing in the open air, reading books and use of internet.

Conclusions: The results reinforce the need of adolescents to practice a healthy lifestyle and the role of family and school in providing the right information to help making right food choices.

Finally in the sample at study the incidence of overweight and obesity was not at all preoccupying, thus indicating that the efforts to provide a good education both at home and at school are adequate and must be carried on.

QUALITY OF LIFE OF CHILDREN AND YOUNG PEOPLE WITH DIABETES MELLITUS TYPE I

Dulce Galvão, Ana Miguêns, Andreia Barreto, Inês Lemos

Nursing School of Coimbra, Portugal.

Contact details: dgalvao@esenfc.pt

Introduction: Diabetes Mellitus type I (DMTI) has become apparent in children/young people, a current and worrisome problem due to increasing incidence and prevalence. In addition to its consequences, it interferes with the quality of life (QOF), representing a public health issue.

Objectives: Characterize the QOL of children/young people with DMTI; identify factors influencing children/young people with DMTI QOL; check DMTI impact in the QOF of children/young people.

Methods: Systematic review of full text studies, published from January 2006 to June 2014 that included the QOF of children/young people with DMTI, children/young people with DMTI with no other pathology and their parents, consulting CINAHL, MEDLINE, MedicLatina, Academic Search Complete, Psychology and Behavioral Sciences Collection and Scholar Google, using “quality of life”, “child*”, “diabetes”. Studies of children/young people with DMTI and other chronic illness were excluded. 546 articles have been identified, 11 selected and seven used.

Results: Parents perceive less QOL and greater impact in the life of children/young people than them. Children/young people QOL improve with the insulin pump and severe hypoglycemic crisis and ketoacidosis decrease. Gender and age group influence children/young people QOL. Severe hypoglycemic crisis are related to the parents’ fear of hypoglycemia, affecting their and their children’s QOL. Young people using complementary and alternative Medicine have better QOL than those using stress relief activities. Children with DMTI have impaired school performance.
Introduction: Evaluation of daily life activities is considered an appropriate and legitimate tool for evaluating the degree of functional (in)dependence in the elderly. Objectives: To evaluate the degree of functional (in)dependence in the elderly living in an long-term institution in the North of Portugal.

Methods: Descriptive cross-sectional study conducted in a long-term residence in the North of Portugal. The sample was constituted by the totality of institutionalized elderly during the month of April 2013, a total of 67. The collection of biographical data was accomplished through the individual process of the elderly. Barthel scale was used to evaluate the degree of (in)dependence through direct observation of daily life activities.

Results: Of the total of 67 seniors, 74 were female, mean age was 83.5 years (SD ± 7.6), varying between 52 and 97 years, 92.5% from countryside, 47.8% can read and write. The most prevalent chronic conditions were hypertension 58.2%, dementia 38.8% and diabetes 31.3%. The Barthel Index revealed 43.3% of the elderly with a degree of total dependence and 11.9% independent. The majority showed independence in feeding 79.1%, in the transfer from the chair to the bed 53.7% and 52.2% in ambulation. The largest proportion of dependence observed in the bath 89.6% in the personal hygiene. It seems to us important that professionals sensitize seniors to the importance of self-care in health promotion and quality of life.

EVALUATION OF FUNCTIONAL (IN)DEPENDENCY IN INSTITUTIONALIZED ELDERLY
Matilde Martinsa, Ana Vilelab, Norberto Silvac

Introduction: The high prevalence of high blood pressure and its hard control lead the scientific community to consider this as a public health problem.

Objectives: To identify the prevalence of hypertension in elderly institutionalized in a home of senior citizens of the District of Bragança.

Methods: A descriptive cross-sectional study performed in a senior citizens home in the district of Bragança. The sample consisted of 67 elderly institutionalized during the month of March 2013. The information was obtained through the records of the individual process of the elderly during the period from 20 to 28 April. Blood Pressure (BP) was assessed to all seniors, by one of the researchers, with electronic vital signs monitor device, following the criteria of the General Directorate of Health.

Results: There was a predominance of the female gender 74%, from countryside 92.5%, and with education level read and write 47.8%. The hypertension prevalence was 58.2%, the average systolic BP was 132.6 mmHg, ranging between 90 and 175 mmHg and diastolic BP averaged was 71.6 mmHg ranging between 42 and 94 mmHg. The average heart rate was 74 beats/minute varying between 50 and 101 beats/minute. The Group of hypertensive patients registered higher prevalence in females 74.4%, with an average age of 84.4 years, 94.9% from countryside and 48.7% could read and write. Concomitantly had diabetes and dementia 35.9%, congestive heart failure 17.9% and stroke 12.8%.

Conclusions: We observed a high prevalence of hypertension which justifies the need for adopting preventive measures. The adoption of healthy lifestyles in this group is an essential component of therapy as well as prevention of hypertension.

MULTI-INDICATORS OF SUCCESSFUL AGING IN CENTENARIANS
Lia Araújoa,b, Laetitia Teixeira,a Oscar Ribeiroa,c, Daniela Brandãoa, Natália Duarte,a, Constança Paúoa,b

Introduction: The multidimensional model of successful aging (Young, Frick & Phelan., 2009) has been serving as a reference in empirical studies of successful aging over the last years (e.g., Pruchno et al., 2010) and a benchmark to assess the health and functioning of very old individuals (Philips Lifeline, 2014). By comprising bio, psycho and social domains, it constitutes a promising approach to the study of the centenarian population who tend to present several age-related losses.

Objectives: The study aims to validate a multidimensional model of successful aging in a sample of Portuguese centenarians.

Methods: 80 centenarians from the PT100 project (Oporto and Beira Interior Centenarians Studies) were face-to-face interviewed. Indicators of disease and physical impairment (physiological domain), emotional vitality and inner contentment (psychological), and engaging with life and spirituality (sociological) were collected.

Results: Structural equation modeling analysis to the hypothesized model suggests removing the social activities indicator (factor loading of 0.07). The alternative model fits well to the observed data, with $\chi^2(24) = 29.058$, $p = 0.218$, CFI = 0.949, GFI = 0.925, RMSEA = 0.052, $p = 0.048$.

Conclusions: The consideration of multi indicators of successful aging enables considering compensatory mechanisms and synergies between physical, psycho and social domains. A greater focus on psychosocial domains values the individual capacities of adaptation, resilience, and coping, which have been tremendously advocated in the gerontological literature (Baltes & Baltes, 1990; Jeste, Depp, & Vahia, 2010).
