Conference President
Professor Aivars Vetra, Riga

President of Baltic and North Sea Forum
Professor Aivars Vetra, Riga

Vice president of Baltic and North Sea Forum
Professor Kristian Borg, Stockholm

Abstract Review Committee
Jan Ekholm, Kristina Schüldt Ekholm (SE) (chairpersons)
Guna Berzina (LV) (secretary)
Frans Nollet, Katharina Stibrant Sunnerhagen, Michael Quit-
tan, Roary O’Connor, Boya Nugraha, Anne Chamberlain, Anita
Vetra, Alvydas Juocevicius, Jaan Korgessar, Jan Lexell, Ulrich
Smolenski, Jürgen Linder

The conference is organized by
Baltic and North Sea Forum on Physical & Rehabilitation Medi-
cine (BNF-PRM) in cooperation with Riga Stradins University,
Karolinska Institutet, Stockholm and Latvian Rehabilitation
Board.

Scientific Committee
Chairman:
Kristian Borg (SE)
Members:
Guna Berzina (LV)
Matthias Bethge (DE)
Gunilla Brodda-Jansen (SE)
Anne Chamberlain (GB),
Alain Delarque (FR)
Jan Ekholm (SE)
Gunnar Grimby (SE)
Christoph Gutenbrunner (DE)
Galina Ivanova (RU)
Ieva Eglė Jamontaitė (LT)
Alvydas Juocevicius (LT)
Olga Kamaeva (RU)

Carlotte Kiekens (BE)
Jaan Korgessar (EE)
Aleksandras Krisciuni (LT)
Ireneusz Marek Kowalski (PL)
Angela McNamara (IR)
Thorsten Meyer (DE)
Frans Nollet (NL)
Boya Nugraha (DE)
Jozef Opara (PL)
Anselm Reiners (DE)
Tiina Rekand (NO/EE)
Kristina Schüldt Ekholm (SE)
Bengt Sjölund (DK)
Katharina Stibrant Sunnerhagen (SE)
Henk Stam (NL)
Johan K Stanghelle (NO)
Guy Vanderstraeten (BE)
Anthony Ward (GB)
Aivars Vētra (LV)
Anita Vētra (LV)

Local Organising Committee
Chairman:
Aivars Vetra (Chairman), Guna Berzina (Secretary), Anita Vetra,
Signe Tomsone, Daina Šmite, Andreta Slavinska

Congress Organisation
Latvia Tours, Riga

Board of Baltic & North Sea Forum, BNF-PRM
Aivars Vetra (President), Kristian Borg (Vice President), Alvydas
Juocevicius, Anne Chamberlain, Ireneusz Kowalski, Gunilla
Brodda Jansen, Boya Nugraha.

Advisory Board of BNF-PRM
Christoph Gutenbrunner (Chairman), Jan Ekholm, Kristina
Schüldt Ekholm, Alain Delarque, Anthony Ward
syndrome may affect all organs and systems, the impact of range of motion limitations caused by immobility on functional capacity to perform activities of daily living is often very severe. Mobilization and active exercise have beneficial effects that counteract the impact of immobility on the body. Objective: This study aims to assess the effect of a mobilization and active exercise program on the range of motion of bedridden patients with disuse syndrome. Method: A quasi-experimental pre-post study was developed. The sample consisted of 26 persons that have been bedridden for more than six months at home. A mobilization and active exercise program was designed, fitting patients’ individual needs and implemented 2 times/week for 2 months. Caregivers where trained to transfer the patient from bed to chair and to repeat active exercise every day. Data collection was performed before and after intervention, using the Barthel Index and a goniometer for range of motion evaluation. Results: 26 study participants, aged 77.19 ± 11.67 and bedridden for 18 months (18.73 ± 15.25) were enrolled, but only 24 completed the intervention program. There was a minimal difference in the sex distribution with 7.6% more women than men. The results showed a statistically significant increase on range of motion of the shoulder, elbow, wrist, hip and knee. There was statistical significance in plantar flexion but not on the dorsiflexion. Barthel Index score increased significantly (28.65±21.28vs31.46±23.28; p=0.035) after the mobilization and active exercise program. Conclusion: A mobilization and active exercise program implemented regularly may contribute to improve range of motion of bedridden patients with disuse syndrome.

INSTITUTIONALIZED ELDERLY REHABILITATION – IMPROVING BALANCE ABILITY WITH A PLATFORM TECHNOLOGY

Manuela Pimentel, BC, Eugénia Mendes, MSc, André Novo, PhD, Leonel Preto, PhD
School of Health, Polytechnic Institute of Bragança, Bragança, Portugal

Introduction: Ageing is associated with a decrease in the functionality of all organic systems. One factor that affects the quality of life in the elderly is the decrease of balance that sometimes leads to falls and consequently the fear of falling. In this sense, it is essential to try to mitigate this progressive degeneration. Wii is a platform technology and method that can be used to improve balance in elderly and thus enable them a better quality of life and well-being. Objective: To investigate whether an exercise programme using Wii games, improve balance in a group of institutionalized elderly. Method: A quasi-experimental study was design in which it was used a sociodemographic questionnaire, nine of the ten tests of Fullerton Balance Advanced Scale to assess balance and the Falls Efficacy Scale (FES) to assess fear of falling. The exercises program where performed on the Wii platform, and applied in 10 minutes session three times a week for two months. Results: Twenty elderly were included, 70% women, with an average age of 82.20±4.92 years, 55% were widowed, 35% single and 10% married. The results of the Fullerton Balance Advanced Scale evaluation showed that 17 elderly improved balance and 3 elderly decreased. The Fear of falling results showed a statistically significant increase (Z=–2.875; p=0.004) from the first to the second assessment moment (67.20±12.07 vs 70.25±12.94). Conclusions: The exercise program set up with the Wii platform improved balance ability and decreased fear of falling in the elderly who participated in this study. Wii games can be used in rehabilitation of elderly to improve balance and reduce fear of falling.

IMPLEMENTING A PROPRIOCEPTIVE EXERCISE PROGRAM IN ELDERLY

Sérgio Garcia, BC, André Novo, PhD, Eugénia Mendes, MSc, Leonel Preto, PhD, Marisa Cunha, MSc

Introduction: With aging, the human body goes through a period of transformation that generates decline of some physical capacities, such as decreased flexibility, agility, coordination, joint mobility and balance, compromising the functional capacity of older people, which is essential for carrying out Activities of Daily Living. The physical exercise is key to improving the functional capacity of the elderly, in particular with proprioceptive exercises, which have been used in recent studies with elderly. Objective: The aim of our study is to evaluate the effects of a proprioceptive exercise program on functional capacity in the elderly group. Method: To achieve this objective, we designed a quasi-experimental study with pre- and post-intervention measurements. All participants were evaluated with hand grip strength, finger pinch force, the Tinetti Gait and Balance Test, single leg balance test, evaluation of senior fitness test by the “arm curl test”, “sit to stand test” “timed up and go test”, “back scratch test” and “chair, sit and reach test “ by Rikli & Jones. The program was conducted 2 times a week for 12 weeks. Results: The sample consisted of 24 elderly, 12 of them in the intervention group (67.25 ± 2.01 years) and the other 12 in a control group (68.08 ± 1.73 years). According to the results, the intervention group showed a statistically significant improvement in all evaluations performed after the program. In the control group, there was no significant improvement in functional capacity components evaluated after 12 weeks. Conclusion: Our proprioceptive exercise program proved to be improving the functional capacity of the elderly. This proprioceptive training program is one of the pioneers in this specific area with great potential for future use.
