Introduction

Diabetes mellitus is a chronic disorder with major expansion worldwide. It's estimated that the number of diabetes sufferers increase rapidly in the coming decades due to the population ageing (Ena, 2016; IDF, 2015). The nutrition intervention emphasizing the promotion of healthy eating has been shown to be an important point in Diabetes Mellitus treatment since it fosters a better glycemic control and lipid profile (ADA, 2016).

Objectives / Methods

To verify the effectiveness of the implementation of programs of physical activity on the blood glucose values and lipid profile in patients with diabetes mellitus. The PICO methodology was used, proceeding to a systematic review of the literature published in 2015 in PubMed/Medline database.

Results/ Discussion

It was found that the adoption of a healthy eating based on consumption of:

- Polysaturated fatty acids (Zheng, Wang, Lin, Yang, & Li, 2015);
- Probiotics (Hove et al., 2015; Ostadrahimi et al., 2015; Tonucci, Obrich Dolos Santos, Licuri de Oliveira, Rocha Ribiero, & Duarte Martinho, 2015);
- Caloric restriction (Nowotny et al., 2015; Nuttall, Akhtyamov, & Gannin, 2015);
- Low consumption of carbohydrates (Nuttall et al., 2015).

...Best glycemic levels and lipid profile in patients with diabetes mellitus since there is:

- Decrease in glucose and fasting insulin levels (Hove et al., 2015; Nowotny et al., 2015; Nuttall et al., 2015; Ostadrahimi et al., 2015; Zheng et al., 2015),
- Decrease in glycated haemoglobin levels (HBA1c), (Nowotny et al., 2015; Ostadrahimi et al., 2015);
- Decrease of insulin resistance (Hove et al., 2015; Zheng et al., 2015) and increases its sensitivity (Nowotny et al., 2015; Nuttall et al., 2015; Tonucci et al., 2015).
- Reduction of weight and body mass index (BMI) (Nowotny et al., 2015; Tonucci et al., 2015; Zheng et al., 2015) (Table 1).

Conclusions

Given the high prevalence of diabetes in the population and in the elderly and as this disease tends to increase with age, it is imperative given its many advantages foster the implementation of dietary programs in accordance with scientifically valid information to make healthy and balanced eating and thus constitute an ally in the prevention and treatment of diabetes mellitus.
