XVII Encontro
GALEGO
PORTUGUÉS
DE QUÍMICA
XVII ENCONTRO GALEGO-PORTUGUÉS DE QUÍMICA

Pontevedra, 9 al 11 de noviembre de 2011
COMISIÓN DIRECTIVA

Baltasar Romão de Castro
José Luís Costa Lima
José Luís Figueiredo
Anxo Pahino Vázquez
Pelayo Rubido Muñiz
Antonio Macho Senra

COMISIÓN CIENTÍFICA

Michael Thompson
Emilia Tojo Suárez
Moisés Canle López
Herminia Bollain Rodríguez
Artur Silva
Joaquim Luís Faria

COMISIÓN ORGANIZADORA

Pelayo Rubido Muñiz (Coordinador)
Gonzalo Mucientes Iglesias
Rafael Álvarez Vázquez
Mª Luisa Fernández Feal
José Mª Fernández Solís
Elia Alonso Rodríguez

Depósito Legal: PO 567-2011
Polymers are part of our everyday lives. They assume different forms such as plastics, fibres, foams and elastomers. Its prevalence in modern society and impact on several industrial sectors is well recognized and motivates the development of different educational tools to support the demonstration of polymer chemistry principles, very often hard to rationalize.

This work aims to present the work developed within the science communication project CV/PVI/1386-Laboratório de Polímeros (Polymer Laboratory), financed by Ciência Viva (2006-2008). Three modules have been developed concerning the following main themes: (1) Polymer concepts; (2) Polymer synthesis and (3) Polymer properties. They were designed to be devoted to a wide target public including students from primary and secondary schools to undergraduate levels, and general society.

Several demonstration/experimental kits were developed. Concepts such as polymer architecture (linear, branched and crosslinked) and polymer synthesis procedures (step versus chain growth polymerization) can be demonstrated by using the “Kit-models”. Here the student is able to create several models representative of the concepts to be illustrated. Synthesis examples include the preparation of linear polymers to networks. In the first case Nylon 6,6 synthesis is proposed and, in the second one, polyurethane foam (chemical crosslinking) and a PVA polymer slime (ionic crosslinking) can be experienced. Among polymer properties, several demonstrations can be mentioned: (1) Dissolution versus swelling, (2) Swelling volume versus crosslinking degree, (3) Hydrophobic versus hydrophilic polymers and (4) Polymer identification.

Following the experience acquired with the former project, the work has continued, expanding the developed concepts. The demonstration/experimental kits were improved, an identification logo was created, and the production of a book of protocols and a web page are currently in course.

Acknowledgments

Financial funding from Agencia Nacional para a Cultura Científica e Tecnológica – Ciência Viva, within the framework of Project CV/PVI/1386. To Saraia Maduro from CIPWeb-Centro de Inovação e Projectos Web do IPB for creating the “Laboratório de Polímeros” logo.
