## [156] - Advances in Simulated Moving Bed Technology

**Thursday, November 16, 2000**  
**Movie Theater 1 - Marriott**

**Chair:** Hemant W. Dandekar  
 UOP LLC  
 25 E. Algonquin Road  
 Des Plaines, IL 60017-5016  
 Telephone Number: 847-391-3641  
 Fax Number: 847-391-3491  
 Email: [hwandek@uop.com](mailto:hwandek@uop.com)

**Vice Chair:** Guoming Zhong  
 Praxair Inc.  
 175 East Park Drive  
 P.O. Box 44  
 Tonawanda, NY 14150-87891  
 Telephone Number: 716-879-4018  
 Fax Number: 716-879-7030  
 Email: [guoming\\_zhong@praxair.com](mailto:guoming_zhong@praxair.com)

### Session Schedule

2:00 PM	<a href="#">Theoretical and Experimental Evaluation of the Influence of Column-to-Column Differences on the Performance of SMB Processes</a>
2:20 PM	<a href="#">New SMB Operation Strategy - Partial Feed</a>
2:40 PM	<a href="#">The Concept of Separation Volume for the Design of SMB Processes</a>
3:00 PM	<a href="#">Simulation, Online Monitoring and Optimization for SMB Chromatography</a>
3:20 PM	Break
3:35 PM	<a href="#">Gas-phase Simulated Moving Bed Separation of the Enantiomers of Inhalation Anaesthetics</a>
3:55 PM	<a href="#">From Simulated Moving Bed to a New, Multi-Column Chromatography Process: The Equilibrium Theory in Question?</a>
4:15 PM	<a href="#">A Simple Adsorber Dynamics Approach to Simulated Countercurrent Moving Bed Reactor Performance</a>
4:35 PM	<a href="#">Application of Simulated Countercurrent Moving Bed Chromatographic Reactor for MTBE Synthesis</a>

### Abstract:

The concept of separation volume for the design of SMB processes

A.E. Rodrigues, L.S.Pais, D. C. Azevedo and M. Minceva

Laboratory of Separation and Reaction Engineering  
Faculty of Engineering, University of Porto  
Rua dos Bragas  
4050-133 Porto, Portugal

The design of Simulated Moving Bed processes for linear, linear+Langmuir and bi-Langmuir systems in the absence of mass transfer resistances can be made based on the equilibrium theory. This leads to the concept of separation region in the plane  $m_3$ - $m_2$  where pure A and B species can be recovered in the extract and raffinate streams, provided that constraints in flowrates in zones I and IV of the SMB are verified.

In the presence of mass transfer resistances these constraints suggested by the equilibrium theory have to be revised and the concept of separation volume is introduced and visualized in a 3-D plot of  $m_1$ - $m_2$ - $m_3$ .

The examples studied at our laboratory include both old and new applications: the separation glucose/fructose where the adsorption isotherms are linear and mass transfer resistance inside the adsorbent is important, chiral separations (Sandoz epoxide and bi-naphtol enantiomers) typical of linear+Langmuir systems and xylenes separations over zeolite pellets where macropore diffusion is the controlling step.

Modeling/simulation was carried out either in steady-state or dynamic situations by using the equivalence with a true moving bed or directly simulating the SMB. The simulator developed at our laboratory is a powerful tool for understanding SMB processes, devising a new concept for designing SMB and training of personnel in industry. It allows the characterization of the process based on criteria of purity, recovery, solvent consumption and productivity. The model allows for intraparticle mass transfer described by a simple linear driving force model and fluid flow is described by axial dispersion model. Experimental results from our laboratory were obtained in a pilot unit from Novasep (France).
