Poster session A

Monday, August 10th 1740-1940

Génopode 2000

Symposium 11. Host defence in a parasitized world: selection, evolution and the maintenance of variation

Resistance and tolerance towards parasites in a polymorphic insect	Willink B. et al.	1
Evolutionary Potential of Ectoparasitism by Mites	Polak M. et al.	1
Coevolution between the red flour beetle and <i>Bacillus thuringiensis</i> bacteria: Transcriptome analysis of host defence after experimental evolution	Milutinovic B. et al.	2
Contemporary evolution of immunity in invasive species: The case of the domestic mouse (<i>Mus musculus domesticus</i>) and of the black rat (<i>Rattus rattus</i>) in Senegal	Diagne C. et al.	2
A targeted proactive response to prevent disease outbreaks in ant societies	Pull C. et al.	3
Parasitism as a driver of age-specific mortality in Asian Elephants (<i>Elephas maximus</i>)	Lynsdale C. et al.	3
Protein evolution of Toll-like receptors 4, 5 and 7 within Galloanserae birds	Vinkler M. et al.	4
Individual multilocus heterozygosity at immune gene loci but not microsatellites influences roe deer natal dispersal	Vanpé C. et al.	4
The QRS (Quantification of Representative Sequences) pipeline for amplicon sequencing: Case study on within population ITS1 sequence variation in a microparasite infecting <i>Daphnia</i>	Gonzalez Tortuero E. et al.	5
Variation of vector competence in <i>Culicoides sonorensis</i>	Morales-Hojas R. et al.	5
Why Sexually Transmitted Bacteria Tend to Cause Infertility: An Evolutionary Hypothesis	Apari P. et al.	6
Ants do drugs to fight disease	Freitag D. et al.	6
Steady state and induced immunity among castes of <i>Formica exsecta</i>	Stucki D. et al.	7
The Impact of Parasite Mediated Selection on the Host's Genetic and Phenotypic Diversity at the Metapopulation Level	Kaufmann A. et al.	7
Use, effectiveness and variability of external immune defense in ants	Tragust S.	8
Multidimensional manipulation of host behaviour explains the ecological success of a social parasite	Foitzik S. et al.	8
Host age modulates parasite within-host competition	Izhar R. et al.	9
Local adaptation between malaria and its bird hosts: An experimental approach	Jenkins T. et al.	9
Variation in Toll-like receptor 4 in closely related passerine species adapted for different environments	Králová T. et al.	10
The Genetic Basis of Behavioral Coevolution: Adaptations in Socially Parasitic Slavemakers and Their Hosts	Alleman A. et al.	10
Mixed diets – the key to a healthy life?	Dickel F. et al.	11
Evolution of immune responses and parasitoid virulence in a spatial context	Hambäck P. et al.	11
How are coevolutionary trajectories affected by variable environments?	Brunner F. et al.	12
Uncovering host defense strategies: Bacterial infection in <i>Drosophila melanogaster</i>	Kutzer M. et al.	12
The relationship between host oxidative stress and <i>Plasmodium</i> infection in the canary, <i>Serinus canaria</i>	Delhaye J. et al.	13
Coinvasion and Coinfection: Evolution and adaptation in two invasive parasites infecting blue mussels	Feis M. et al.	13
Gene diversity of Major histocompatibility complex (MHC) class II β alleles of Scandinavian anuran species	Cortazar Chinarro M. et al.	14
Disentangling genetic and parental effects in determining immune function in a simultaneously hermaphroditic snail	Seppälä O. et al.	14
Microbiota plays a role in oral immune priming in <i>Tribolium castaneum</i>	Futo M. et al.	15
Not all MHC alleles are equal: Different characteristics of MHC Class I alleles among song birds	O'Connor E. et al.	15
Use of Concanavalin A in skin-swelling test of immune responsiveness facilitates interpretation of the measurement in rodents	Bílková B. et al.	16

Microgeographic variation in tropical trees: Selection shapes intra-population divergence at hundreds of loci	Scotti I. et al.	165
Reconstructing past demography from population specific FSTs	Goudet J. et al.	165
Searching for signatures of selection in Iberian honey bee (<i>Apis mellifera iberiensis</i>) using whole genome sequences	Martins Henriques D. et al.	166
Selection pressures and recent adaptation in the genomes of invasive fire ants	Privman E. et al.	166
The Evolution and Divergence of the Special Homeobox Genes in <i>Pararge aegeria</i>	Livraghi L. et al.	167
The evolution of genomes and fitness traits in response to environmental change in the emerging model system <i>Daphnia</i>	Orsini L. et al.	167
The evolutionary challenge of climate change : Adaptive processes in the Mediterranean red coral	Pratlong M. et al.	168
The evolutionary history of <i>Cochlearia</i> (Brassicaceae) in Central Europe: Population- and phylogenomics of a cold relic in a warming world	Koch M. et al.	168
The genome-wide landscape of population genetic variation in brown rat (<i>Rattus norvegicus</i>) populations	Gavan M. et al.	169
The genomic basis of colour dimorphism and cold adaptations in a seabird	Tigano A. et al.	169
Using a landscape genomic analysis to detect selection by climate in natural populations of a Mexican endemic oak, <i>Quercus rugosa</i>	Martins K. et al.	170
Phylogeography, population structure and phenotypic variation in the wing dimorphic grasshopper <i>Dichroplus vittatus</i> (Orthoptera: Acrididae)	Remis M.	171
Symposium 28. Variation in natural selection: patterns, causes, and consequences		
Inference and misinference under models of Background Selection	Ewing G. et al.	172
A case of rapid postglacial speciation in the songbird genus <i>Junco</i> : Genome-wide divergence in SNP data suggests the role of multifarious selection	Friis G. et al.	172
An approximate Bayesian estimator of allele age and selection strength	Ormond L. et al.	173
An experiment in the wild to test if stickleback males adapt their colour to the ambient light environment	Veen T. et al.	173
An unexpected oviposition preference of the common bush brown (<i>Bicyclus safitza</i>) may help to explain butterfly-host plant coevolution	Nokelainen O. et al.	174
Assessing local adaptation in Aleppo pine by comparing molecular and phenotypic variation	Martín-Sanz R. et al.	174
Asymmetric gene flow between populations of the marine crab <i>Liocarcinus depurator</i>	Mestres F. et al.	175
Can fluctuating selection explain levels of variation in natural populations?	Novak S. et al.	175
Carry-over effects of the social environment on future divorce probability in great tits	Radersma R. et al.	176
Catch me if you can: Adaptation from standing genetic variation to a moving phenotypic optimum	Matuszewski S. et al.	176
Chronology of fitness traits evolution to climate change over 100 years in the water flea <i>Daphnia magna</i>	Cuenca Cambronero M. et al.	177
Cryptic species within a cardinalfish: Evidence for ecological speciation in the coral reef	Gerlach G. et al.	177
Dominance genetic variance for traits under directional selection in <i>Drosophila serrata</i>	Sztepanacz J. et al.	178
Effects of environmental heterogeneity on phenotypic and genetic variance components in a tree swallow population	Bourret A. et al.	178
Effects of temperature dependent survival during early development on adult fitness traits	Schäfer M.	179
Empirical insights of the effects of pollen flow on the adaptive potential of <i>Fagus sylvatica</i> populations	Gauzere J. et al.	179
Environment-dependent patterns of phenotypic integration in Aleppo pine	Climent J. et al.	180
Environment-dependent sexual selection: Bateman's parameters under varying levels of food availability	Chapuis E. et al.	180
Estimating Selection of Skull Shape using Geometric Morphometrics	Damasceno E. et al.	181
Eusociality influence on the effective population size	Vieira B. et al.	181
Evaluation of adaptive potential of the European eel population suggests a recovery of its genetic status	Baltazar-Soares M. et al.	182

Searching for signatures of selection in Iberian honey bee (*Apis mellifera iberiensis*) using whole genome sequences

Introduction

The Iberian Peninsula comprises a diverse set of habitats. It was an important glacial refugium during the Pleistocene and has served as a bridge for populations migrating between Africa and Europe, resulting in a complex mix of ancestry and diversity. The Iberian honey bee (*A. m. iberiensis*) is no exception and has been the subject of numerous incongruent population genetic surveys. Recent mtDNA and SNP analyses indicate a steep northeastern-southwestern cline of African-European ancestry along the peninsula, which has been explained by selection and demography.

Advances in DNA sequencing technology and computational tools provide unprecedented opportunities to study demography, search for signatures of selection across the genome and illuminate its role in shaping genomic diversity. We used Illumina technology to sequence the whole genomes of 86 Iberian honeybees. To verify whether there are signals of genetic adaptation we have done simple pairwise comparisons between populations located in extremes of environmental variables, like precipitation and temperature (Fig.1).

Methods

Genome sequencing

Illumina technology was used to sequence the whole genomes of 86 Iberian honeybees collected across three north-south transects in the Iberian Peninsula (Fig.1).

The reads were mapped against the reference genome Amel_4.5 using BWA.

Several steps of quality control were done:

- Identify and marked PCR duplicates: Picard;
- Identify regions of poorly and inconsistently mapped reads: GATK45;
- SNP calling: FreeBayes.

In order to reduce the number of false SNPs, we removed the following SNPs:

- Quality below 50;
- Depth below 123 or higher than 3000;
- With less than 37 alleles.

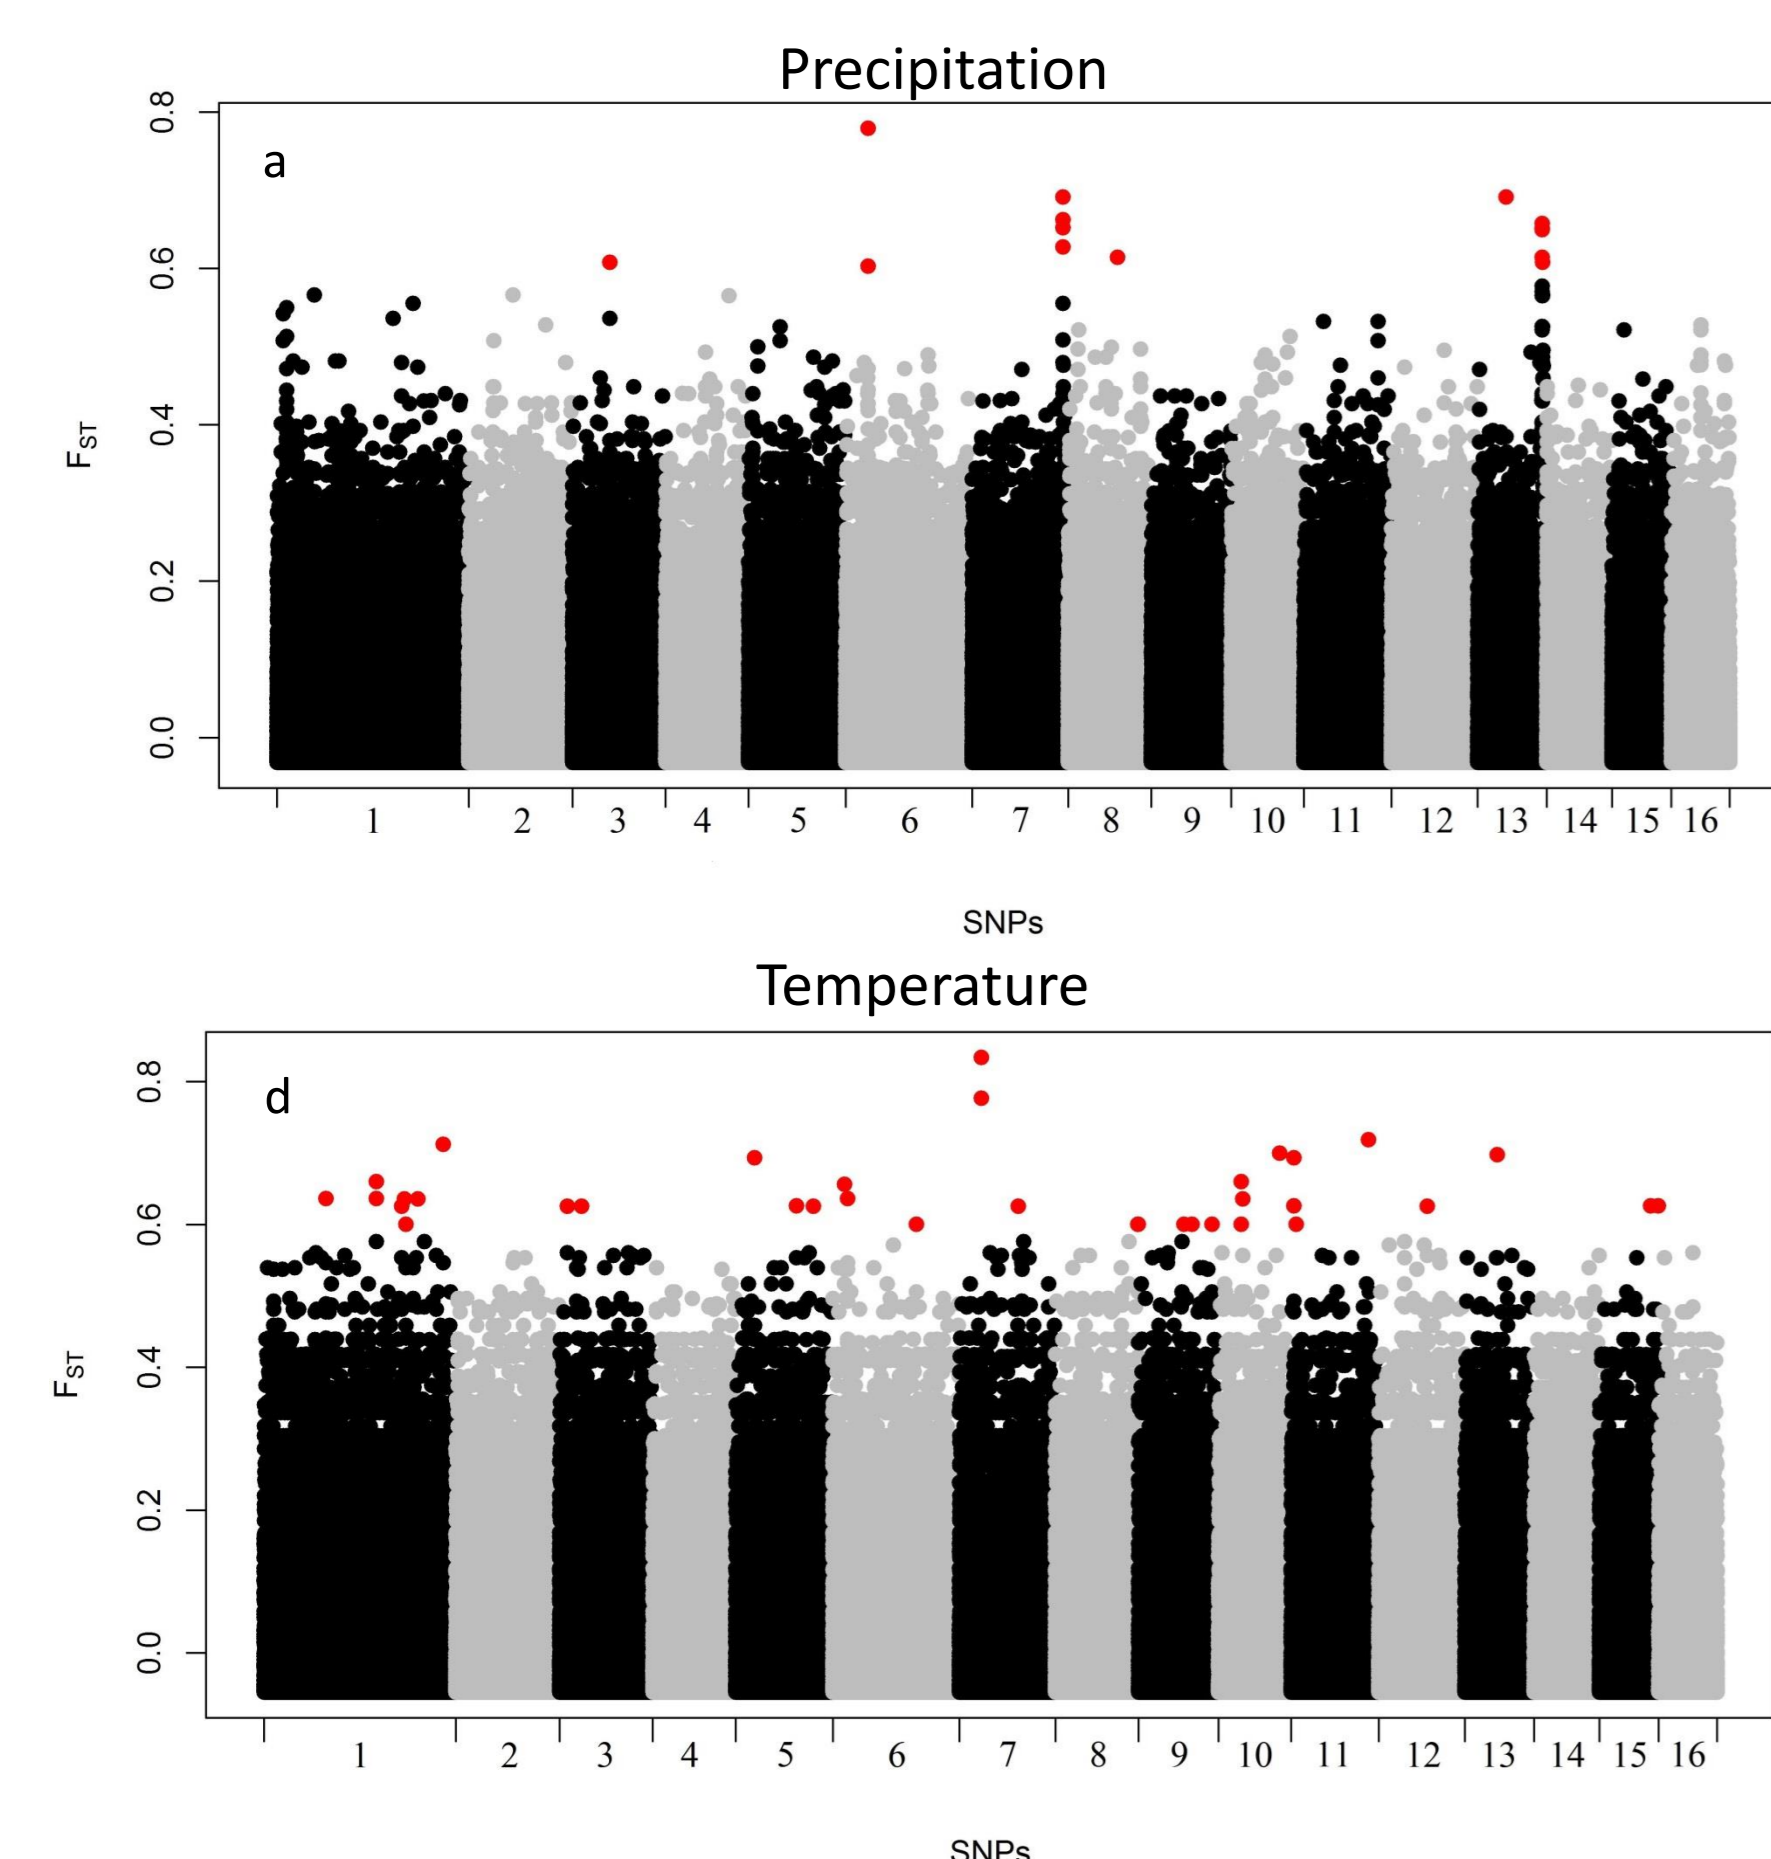

- In total the dataset is composed by 1289449 SNPs.

The environmental data were obtained from the Climatic Research Unit (www.cru.uea.ac.uk) and ArcGIS was used to manipulate the data

Results and Discussion

Precipitation

A total of 29 SNPs have a F_{ST} higher than 0.60 (represented in red) and are mainly in chromosomes 7 and 13 (Fig.2,a), most of these SNPs are near or inside genes (a total of 9 genes) in this case just one SNP are in one intron with a distance from the nearest gene higher than 1000pb (Fig.2,1b). A total of 6 outlier SNPs are near to the gene GB48105, that is a probable cytochrome P450. The gene GB49882 also show 6 outlier SNPs, and this are responsible for potassium voltage channel. The functionally related groups obtained using the genes that have outlier SNPs have functions related to metabolism and cell structure (Fig2, 1c).

c

N° of genes	Putative Function	Term	P-value
2	Metabolism	Response to insecticide	4.5 E-3
2	Metabolism	Response to toxin	6.0 E-3
2	Structural	Transmembrane protein	3.3 E-2
3	Structural	Membrane	9.1 E-2

f

N° of genes	Putative Function	Term	P-value
3	Development	peripheral nervous system development	1.30E-02
4	Development	imaginal disc development	4.70E-02
3	Morphogenesis	imaginal disc morphogenesis	1.10E-01
3	Morphogenesis	post-embryonic organ morphogenesis	1.10E-01
3	Development	post-embryonic organ development	1.20E-01
3	Morphogenesis	instar larval or pupal morphogenesis	1.50E-01
3	Morphogenesis	post-embryonic morphogenesis	1.60E-01
3	Morphogenesis	metamorphosis	1.60E-01
3	Development	instar larval or pupal development	2.00E-01
3	Development	post-embryonic development	2.20E-01
3	Morphogenesis	pattern specification process	2.50E-01

Figure 2: Distribution of pairwise F_{ST} at all SNPs along the genome for the precipitation (a) and temperature (d). The red plots represent SNPs with a F_{ST} higher than 0.60. The distribution of the SNP outliers in different categories (b,e). Intron: SNPs located in introns at more than 1000pb from a gene; Intron_near: SNPs located at less than 1000pb from a gene; Syn: synonymous; Non_Syn: Non synonymous; Intergenic: SNPs located in intergenic region at more than 1000pb from a gene; Interg_near: SNPs located at less than 1000pb from a gene. In d is represent a table with functionally related groups for precipitation (c) and temperature (f).

Searching for signals of selection:

In order to confirm whether there are signals of genetic adaptation to different environments we selected the populations that are in the extremes of environmental variables (precipitation and temperature) (Fig.1) and we performed a pairwise F_{ST} at all SNPs between these populations using plink (Fig.2).

The database DAVID Bioinformatics Resources 6.7 (<https://david.ncicrf.gov/>) were used to check whether SNPs with extreme differences in frequency between populations from different environments are enriched in genes

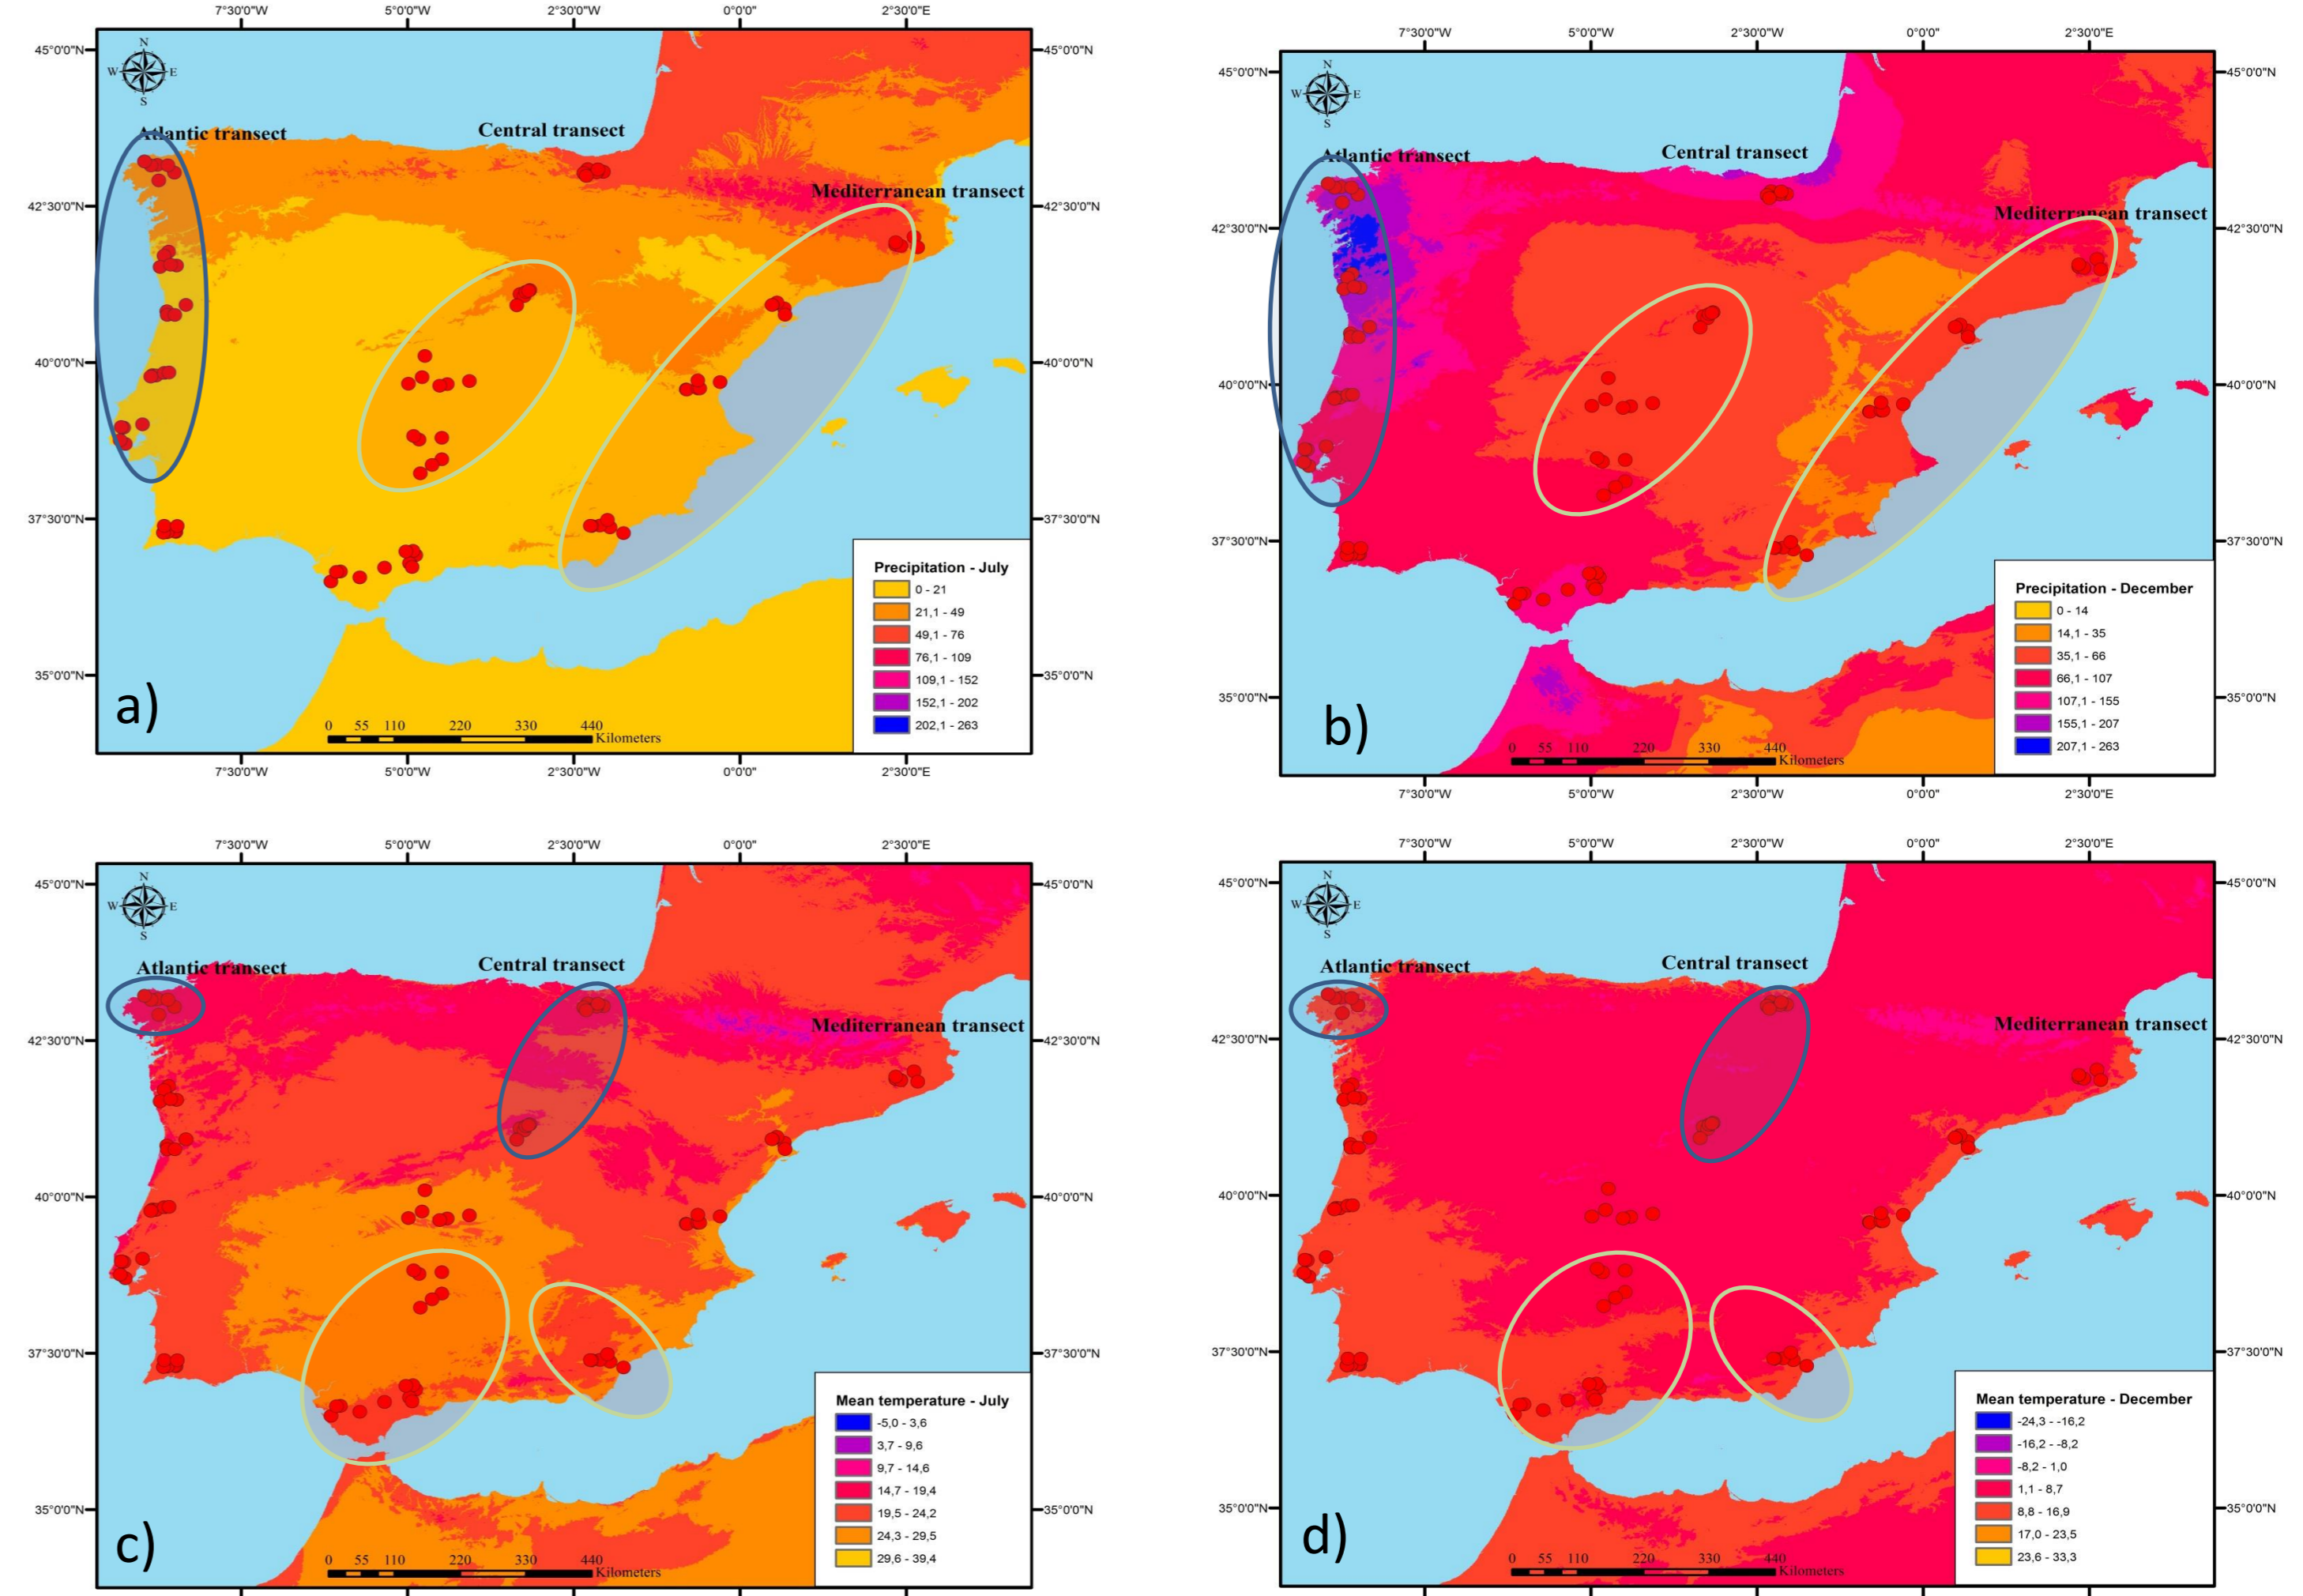

Figure 1: Map representing the distribution of precipitation in July (a) and December (b) and temperature in July (c) and December (d). The circles in different colors represent the two groups used to perform the analysis. The red spots are the samples position of the individuals used in this study.

Temperature

A total of 60 SNPs have a F_{ST} higher than 0.60 (represented in red) (Fig2,d). Most of the SNPs are located in introns but near to genes (less than 1000pb) (Fig2,e). The gene GB46620 has 15 outlier SNPs that is an uncharacterized protein homolog with C1orf11.

Two functionally related groups were obtained with the temperatures outliers, the group with higher enrichment score (0.95) it is in figure 2,f. It is possible to observe that the genes are very related with different phases of bee development and morphogenesis.

Conclusion

These results confirm the influence of environmental variables in the local adaptation of Iberian honey bee. Precipitation was associated a genes related to detoxification mechanisms and membrane transports. It is known that temperature is important in the life cycle of insects, and this study confirm that, since temperature is associated with several genes related to development and morphogenesis.

We owe special thanks to beekeepers from Spain and Portugal for their valuable help in obtaining samples. Antonio Pajuelo provided the contacts of Spanish beekeepers. DNA extraction and SNP genotyping were performed by Colette Abbey. Special thanks to Margarida Neto, Andreia Brandao and Irene Muoz for collaborating in the sampling. JC-G and DH are supported by Fundaao para a Ciencia e Tecnologia (FCT) through the scholarships SFRH/BD/68682/2010 and SFRH/BD/84195/2012, respectively. This research was funded by FCT and COMPETE/QREN/EU through the project PTDC/BIA-BEC/099640/2008 and BiodivERsA-FACCE2014-91.
