

BOOK OF ABSTRACTS

TITLE

Book of Abstracts of the XX EuroFoodChem Congress

EDITORS

M. Beatriz P.P. Oliveira, Joana S. Amaral, Manuel A. Coimbra

EDITION

Sociedade Portuguesa de Química
Av. Da República, 45 – 3º Esq
1050-187 Lisboa – Portugal

DATE

June 2019

ISBN

ISBN 978-989-8124-26-5

The editors state that the content of scientific abstracts is of the responsibility of their respective authors.

XX EUROFOODCHEM CONGRESS

Scientific Committee

M. Beatriz Oliveira (Portugal)
Manuel A. Coimbra (Portugal)
Marco Arlorio (Italy) – Chair, EuChemS FCD
Joana Amaral (Portugal) – Secretary, FCD-EuChemS
Michael Murkovic (Austria) – Treasurer, EuChemS FCD
Hans-Jacob Skarpeid (Norway)
Juana Frias (Spain)
Livia Simon Sarkadi (Hungary)
Tanja Dcirkovic Velickovic (Serbia)
Vieno Piironen (Finland)
Vincenzo Fogliano (The Netherlands)

Organizing Committee

M. Beatriz Oliveira (Portugal) – University of Porto
Manuel A. Coimbra (Portugal) – University of Aveiro
Joana Amaral (Portugal) – Polytechnic Institute of Bragança, FCD-EuChemS

Congress organized under the auspices of the Food Chemistry Division of the European Chemical Society (FCD-EuChemS) and the Portuguese Chemical Society (SPQ).

Identifying the geographical origin of Serra da Estrela PDO cheeses using fatty acids profiles

Serra da Estrela is a traditional Portuguese cheese with a Protected Designation of Origin (PDO) certification. This cheese is produced from raw ewe's milk from "Churra Mondegueira" and "Bordaleira" Portuguese autochthonous breeds and coagulated using wild thistle flower (*Cynara cardunculus* L.), and its production is geographically limited. Serra da Estrela is the most known and popular Portuguese cheese and is appreciated worldwide, being preferentially consumed as a soft cheese, with an average maturation of 30-45 days, although some consumers prefer to consume it as a hard cheese after at least 6 months of storage [1]. Due to its social and agroeconomic relevance, Serra da Estrela cheese is prone to geographical origin adulterations. The present work aims to verify if the fatty acids (FA) profile could be used as a geographical origin biomarker. The results showed that, although a similar FA profile (23 individual fatty acids identified, being the most abundant ones: C_{4:0}, C_{6:0}, C_{8:0}, C_{10:0}, C_{12:0}, C_{14:0}, C_{16:0}, C_{18:0}, C_{18:1n9c}, C_{18:2n6t}, C_{18:2n6c} and C_{18:3n3}) could be established for all cheeses, regardless the producer, geographical origin and production date, the overall profile could be used for discriminating the cheeses according to their geographical origin (5 municipalities within the PDO region). A linear discriminant analysis (LDA) with the simulated annealing (SA) algorithm enabled establishing a classification model that was able to correctly classify 96% of the original grouped samples (**Fig.1**) and had a predictive sensitivity of 88% (leave-one-out cross-validation). So, FA profile could be used as a geographical origin authentication tool, providing the consumer a guarantee regarding this high-value and appreciated food.

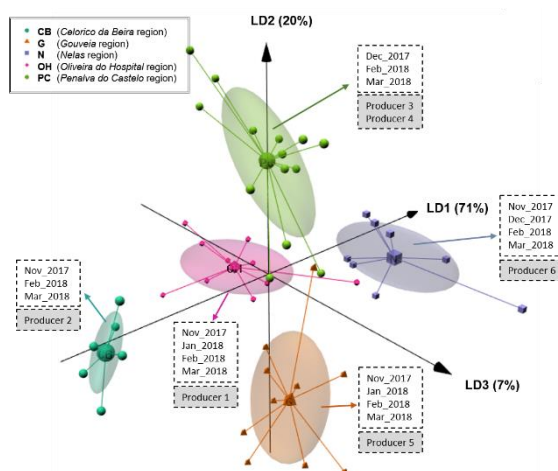

Fig.1. LDA-SA discrimination of Serra da Estrela PDO cheeses by geographical origin.
